

LIVEWIRE™

Simplify server protection and on-demand recovery with Livewire.

Livewire is a streamlined, full-server data protection solution that reduces costs for businesses by simplifying the protection and recovery of important business systems. A well-organized user interface makes Livewire easy for non-technical staff to install and maintain. Once installed, Livewire continuously replicates changes to data, applications, and the source server's operating system, protecting the entire server. When it's time to recover, Livewire allows you to configure and perform recoveries on-demand, to physically dissimilar hardware or virtual servers, with added validation steps to make sure recovery will go as planned. Optionally, Livewire can also be used to migrate a server to different hardware, and then repurpose the software for protection of the newly migrated workload.

Reliable Protection.

Not all workloads are created equal. Applications and systems that are critical to the business but don't need the high availability provided by replication and failover products like Double-Take for Windows, can be easily protected and recovered on-demand using Livewire. While Livewire provides a unique recovery option for customers, it is still built on Double-Take replication technology; the same technology over half the Fortune 500 companies have been relying on for over ten years.

Simple Installation and Management.

The Livewire Management Console allows you to quickly and easily configure, manage and perform recoveries from a single interface, and includes validation steps that ensure recovery goes as planned. A single monitoring screen shows all full-server protections and recoveries across the enterprise with full status sorting and filtering capabilities. Jobs are categorized into protected, warning, and error states for quick identification of needed interaction.

Fast Recovery.

When a system volume or entire server fails, recovery of both system state and data can be performed from the Livewire Management Console. This reduces the number of steps and time needed to recover a server to its original state, improving achievable recovery time objectives (RTO). The Livewire Management Console also push installs the Livewire agent to the recovery server if necessary, eliminating the need to have Livewire pre-installed on the recovery server.

Infinitely Flexible.

The recovery process can account for a variety of differences between the original source and recovery server, prohibit incompatible differences, and warn the user of possible performance degradations after recovery. Livewire replicates between any configuration of physical and virtual systems.

System Requirements

Operating System (Source Servers)
 Microsoft® Windows® 2003 or 2003 R2 Enterprise, Standard, Web, SBS, Enterprise x64 or Standard x64
